

Maintenance of balustrade systems

Stainless steel is one of the most durable options for an internal or external handrail or balustrade system but stainless does not mean stain free. All our steel is grade 316 which means it can be used internally or externally. To maintain the initial appearance of your balustrade whether stainless steel or aluminium it will require regular cleaning.

How often will depend upon location as systems by the sea can collect salt deposits and city centres or systems near power stations can collect deposits that can contaminate and stain your system if not cleaned regularly.

We recommend all systems are cleaned monthly with a warm water and mild detergent. In the event of tarnishing due to a less regular cleaning program can be removed with some elbow grease and chemical cleaner like “never dull” but it is better to give a regular gentle clean than a more intermittent deep clean.
