

# Non standard floor height

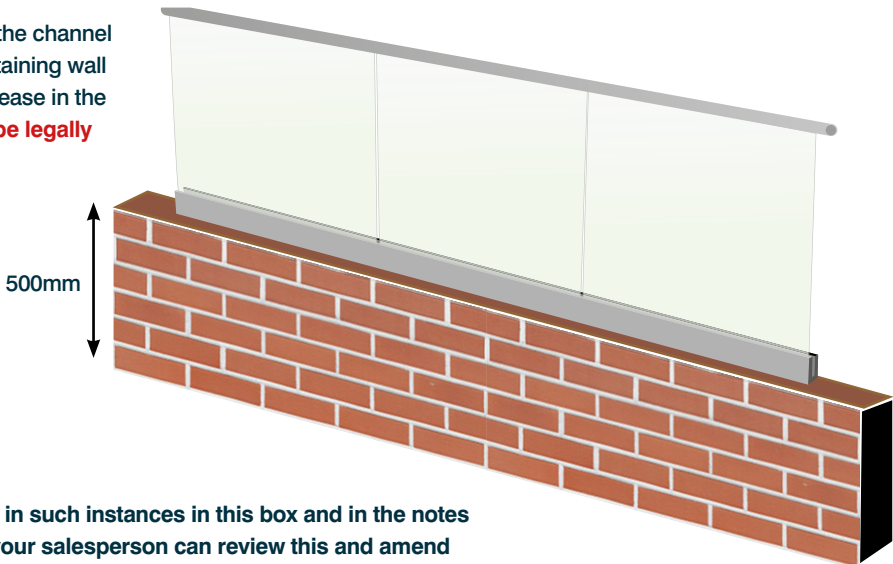

Generally external balustrades should be 1100mm high and internal systems and all stairs should be 900mm from finished floor level (also called the datum). You will have advised us of this earlier when selecting your kN rating and indicating if indoors/ internal or outdoors/ external use.

This is for demonstrative purposes only and is not necessarily the system you are selecting but shows what we mean when we ask if your system is a nonstandard height. Whatever balustrade system you are selecting the principle is the same.

In this instance the channel is set into the floor requiring an increase in the glass height **to be legally compliant.**

In this instance the channel is on top of a retaining wall requiring a decrease in the glass height **to be legally compliant.**

Please advise us in such instances in this box and in the notes section later so your salesperson can review this and amend your quote to accommodate this should you request us to do so.
