

# Wind load post systems

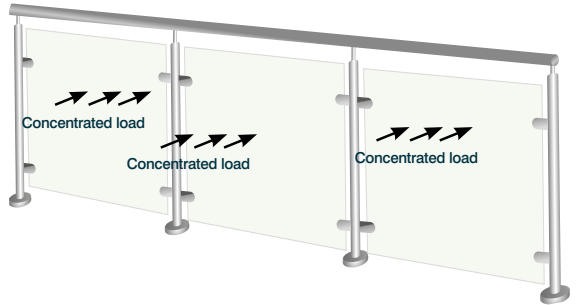

All our balustrades systems are fully compatible in a high wind load. We can supply a wind load calculation for your balcony which can be requested for £60 + VAT but generally these are not needed if the client uses some common sense in that if you feel there is a potential high wind load simply use the high wind load anchoring solution in our certification library at [www.made2measure/balustrades/certifications](http://www.made2measure/balustrades/certifications) which holds details from an independent structural engineer into concrete, steel and timber.

Please note this is the only data we have and we cannot provide further data into other substrates - if you cannot follow these instructions then you can use them for guidance but you may decide to use a structural engineer to sign off your project.

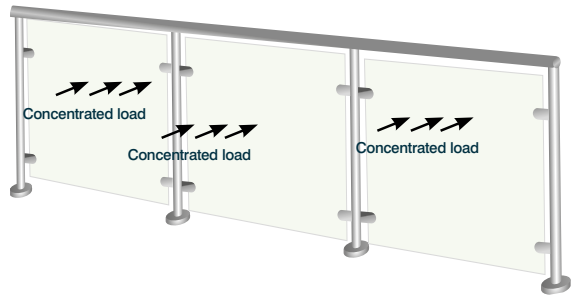

Any balcony over 8m should be deemed a high wind load as a matter of course.

Extreme wind loads are not covered by any of our systems. If you feel you may be in such a location you must request a wind load report to proceed forward safely in the knowledge what you are buying is fit for purpose.
